Abstract

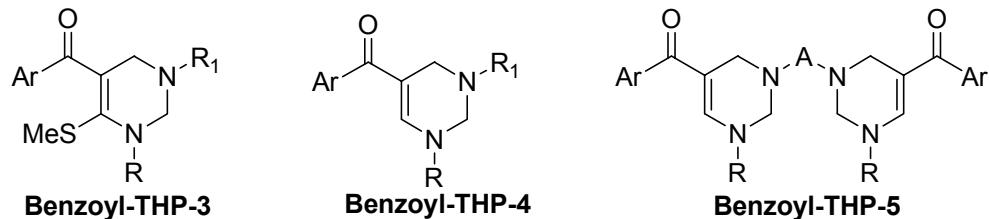

Novel 5-isonicotinoyl-1,2,3,4-tetrahydropyrimidines **4a-i** have been synthesized in good yields by the reaction of enaminones **3a-c**, primary amines and formaldehyde. **4a-i** have been screened for their antibacterial properties. Enaminones **3a-c** have also been reacted with diamines and formaldehyde to give hitherto unreported bis-tetrahydropyrimidines **5a-l** in good yields. The structures of **4a-i** and **5a-l** have been established with the help of spectral and analytical data.

Keywords: 4-Acetylpyridine, tetrahydropyrimidines, isonicotinoyl, bis- tetrahydropyrimidines

Introduction

Prompted by the biological activities of 5-nitro-1,2,3,4-tetrahydropyrimidine derivatives (Nitro-THP-1)¹ & (Nitro-THP-2),² we have recently reported facile synthetic routes to novel 5-benzoyl-6-methylthio-1,2,3,4-tetrahydropyrimidines (Benzoyl-THP-3),³ 5-benzoyl-1,2,3,4-tetrahydropyrimidines (Benzoyl-THP-4)⁴ and bis-(5-benzoyl-1,2,3,4-tetrahydropyrimidines) (Benzoyl-THP-5)⁵ replacing the nitro group of position 5 of the tetrahydropyrimidine (THP) rings by benzoyl groups.

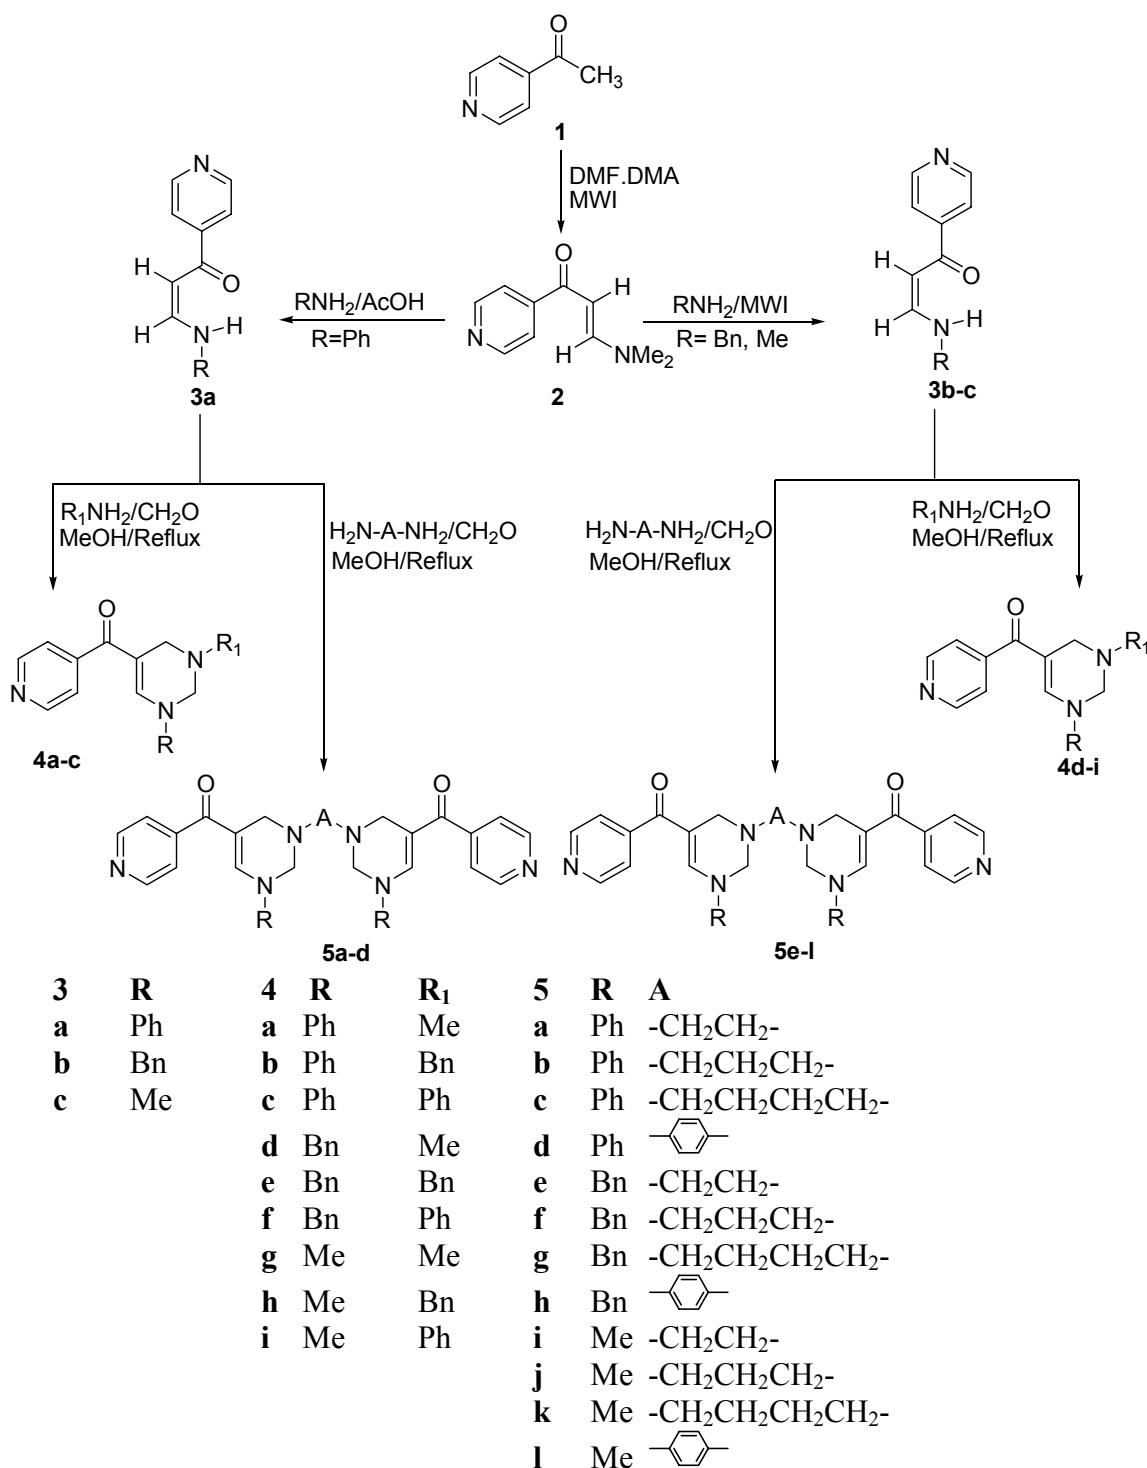

We envisaged that presence of another electron withdrawing group in position 5 of the tetrahydropyrimidine ring could have an important impact on the biological activities of these molecules. Our literature survey at this stage revealed that 1,2,3,4-tetrahydropyrimidines and bis-(1,2,3,4-tetrahydropyrimidines) bearing isonicotinoyl group in position 5 of the ring are unknown in the literature to the best our knowledge and hence their biological properties remain unexplored. Furthermore, bis-compounds have received considerable importance as being model for main chain polymers.⁶⁻¹⁰ It is also reported that many biologically active natural and synthetic products have symmetry.¹¹ As a result, many research groups are turning their attention to the synthesis of bis-heterocycles.¹²⁻¹⁵ Prompted by the promising biological properties of the tetrahydropyrimidines and hence bis-tetrahydropyrimidines bearing electron-withdrawing groups in position 5 of the ring, we decided to develop synthetic methodologies for 5-isonicotinoyl-1,2,3,4-tetrahydropyrimidines and bis-(5-isonicotinoyl-1,2,3,4-tetrahydropyrimidines) and the results of our studies are reported herein. Antibacterial properties of 5-isonicotinoyl-1,2,3,4-tetrahydropyrimidine derivatives have been studied and the results are presented in this paper.

Results and Discussion

In order to synthesize the proposed THPs bearing isonicotinyl group in position 5, enaminones of the type **3** derived from 4-acetylpyridine were required. Their synthesis could be achieved by first reacting 4-acetylpyridine with DMF-DMA following a previously reported procedure¹⁶ to yield the formylated product **2** and then converting **2** into **3** by a procedure¹⁷ developed in our laboratory. The structures of **3** as 3-(phenyl/benzyl/methyl)amino-1-isonicotinoylpropanones were established with help of spectral and analytical data (experimental section). The enaminones **3a-c** exist exclusively in Z-form as indicated by the highly deshielded N-H proton (10.76-12.25 ppm) signals due to hydrogen bonding and the low coupling constants of the vinylic protons ($J=6$ Hz).

Synthesis of the desired tetrahydropyrimidines was subsequently undertaken. Thus when a mixture of enaminone **3a**, methylamine and formaldehyde (1:1:2) in methanol was heated at reflux, work up of the reaction mixture gave **4a** in 80% yields, the structure of which was proposed to be (1,2,3,4-Tetrahydro-3-methyl-1-phenylpyrimidin-5-yl)(pyridin-4-yl)methanone on the basis of spectral and analytical data. The reaction of **3a** with other primary amines (benzyl amine or aniline) and formaldehyde proceeded under similar conditions giving the respective tetrahydropyrimidines **4b** and **4c** in 83% and 85% yields respectively. Similarly, the reaction of

3b-c with appropriate primary amines (Scheme 1) and formaldehyde proceeded smoothly, giving the respective products **4d-i** in good yields.

Scheme 1

The infrared spectra of **4a-i** showed strong peaks in the region of 1500 to 1630 cm⁻¹ due to extensively delocalised double bonds and carbonyl groups. In the ¹H nmr spectra of **4a-i**, the α and β protons of pyridine ring appear as doublets in the vicinity of 8.60 and 7.30 ppm respectively. The signal of C₆-H proton of the THP ring remains obscured by the aromatic protons except in case of **4g**, where it was found resonating at 6.97 ppm. The signals due to benzylic CH₂ protons in **4b**, **4d-f** and **4h** were found in the range of 3.65-3.90 ppm. The protons at C-4 of the THP ring resonated just below 4.00 ppm except in cases where phenyl group is attached to N-3, while those bonded to C-2 were more de-shielded and resonated in the vicinity of 4.50 ppm. In the ¹³C nmr spectra of the THPs, the most striking signal was due to carbonyl carbon (close to 190 ppm).

Subsequently, the reaction of **3** with diamines and formaldehyde was examined. Thus, when **3a** (2 mmol) was reacted with a mixture of ethylenediamine (1 mmol) and formaldehyde (4 mmol) in methanol, expected product **5a** was obtained in 55% yield, the structure of which was established to be [3,3'-(ethane-1,2-diyl)bis(1-phenyl-1,2,3,4-tetrahydropyrimidine-5,3-diyl)]bis(pyridin-4-ylmethanone) based on spectral and analytical data. The reaction of **3a** with other diamines (A= -CH₂CH₂CH₂-, -CH₂CH₂CH₂CH₂-, -C₆H₄-) and formaldehyde led to the formation of the respective products **5b-d** in 60-65% yields. Likewise, **3b** and **3c** reacted with diamines and formaldehyde under similar conditions giving the expected products **5e-i** in good yields. The N-CH₂ protons of the linker chain of **5a-c**, **e-g**, **i-k** resonated between 2.40 to 2.80 ppm, while other CH₂ protons of the linker chains appeared as multiplets close to 1.75 ppm. The protons of the aromatic linkers remained obscured by other aromatic proton signals in their usual range.

Anti-bacterial properties of tetrahydropyrimidines **4a-i**

Of the nine THPs **4a-i** tested, only **4b**, **4e**, **4d**, **4i** and **4h** exhibited anti-bacterial effect on the four-gram positive bacteria. None of the compounds inhibited the growth of *E. coli*, a gram-negative species, at the concentrations tested. Compound **4b** inhibited the growth of *S. aureus*, *S. epidermidis*, *B. subtilis*, *B. mycoides* at 10 mg/ml and 5 mg/ml concentrations. The differences in the mean zones of inhibitions observed were not significant, when comparisons are made both within a concentration and between the concentrations (Table 1). Compound **4b** had a greater bactericidal effect on *B. mycoides* than on the other species; growth of *B. mycoides* was affected at 2.5 mg/ml and 1.25 mg/ml concentrations of **4b** also. The mean zone of inhibition at these concentrations, however, was not significantly different from the values obtained at higher concentrations. Compound **4e** inhibited the growth of *S. aureus*, *S. epidermidis* and *B. subtilis*. This compound was not bactericidal on *B. mycoides* and *E. coli* at the concentrations tested. The values of the zones of inhibition recorded in *S. aureus*, *S. epidermidis* and *B. subtilis* cultures were not significantly different at 10 mg/ml concentration of **4e**. This compound inhibited growth of *S. aureus* at 5 mg/ml concentration and *B. subtilis* at 5 mg/ml, 2.5 mg/ml, 1.25 mg/ml concentrations; however, significant differences did not exist at these concentrations (Table 1). When *S. aureus* and *B. subtilis* cultures were exposed to 10 mg/ml concentration of **4e**, the mean

zone of inhibition observed, 0.68 ± 0.08 cm and 0.72 ± 0.05 cm respectively were significantly higher than the mean zone of inhibition observed (0.1 ± 0.1 cm) when *S. aureus* was exposed to 5 mg/ml of **4e**.

Compound **4d** inhibited the growth of *S. aureus*, *S. epidermidis* and *B. subtilis* only at 10mg/ml and 5 mg/ml concentrations; but significant differences between the mean values did not exist. *B. mycoides* and *E. coli* were not affected by **4d**.

Compound **4i** inhibited growth of *S. epidermidis* at 10 mg/ml concentration. Anti-bacterial effect of this compound was not observed on any of the other cultures at the concentrations tested (Table 1).

Compound **4h** has inhibitory effect on *S. epidermidis*, *S. aureus*, and *B. mycoides* of which *S. epidermidis* was the least affected; it was inhibited only at 10 mg/ml concentration. Growth of *S. aureus*, and *B. mycoides* was inhibited at 10, 5 and 2.5 mg/ml concentrations. The diameter (0.13 ± 0.13 cm) of the mean zone of inhibition recorded in *S. aureus* cultures at 2.5 mg/ml concentration was significantly lower than values recorded due to **4h** except when *S. aureus* was exposed to 5 mg/ml concentration (0.64 ± 0.16 cm).

The anti-bacterial effect of rifampicin was significantly higher on all bacterial species at 1 mg/ml concentration when comparisons are made with the anti-bactericidal effect of **4a-i** (Table 1). The solvent controls did not display growth inhibition in any of the bacterial species.

Conclusions

In conclusion, we have synthesized a set of nine hitherto unknown 5-isonicotinyl-1,2,3,4-tetrahydropyrimidines and another set of twelve bis-(5-isonicotinyl-1,2,3,4-tetrahydropyrimidines) in good yields. Anti-bacterial properties of the tetrahydropyrimidines have been studied. Compounds **4b**, **4e**, **4d**, **4i** & **4h** were found to possess anti-bacterial activity on four gram-positive bacteria used in the study. However, variations in anti-bacterial activity, as indicated by mean zones of inhibition, were observed. Compound **4h** produced highest mean zone of inhibition (1.04 ± 0.1 cm) on *Bacillus mycoides*, at 10mg/mL concentration

Experimental Section

General. Melting points were recorded by open capillary method and are uncorrected. The IR spectra were recorded on a Perkin-Elmer 983 spectrometer. ^1H NMR and ^{13}C NMR spectra were recorded on Bruker ACF-300 spectrometer. The chemical shifts (δ ppm) and the coupling constants (Hz) are reported in the standard fashion with reference to TMS as internal reference. FAB-mass spectra (MS) were measured on JEOL 3SX 102/DA-6000 mass spectrometer using argon as the carrier and m-nitrobenzylalcohol as the matrix. Elemental analyses were performed on a Vario-EL III instrument. Enaminone **2** was synthesized by a reported procedure.¹⁶

3-Phenylamino-1-pyridin-4-ylpropenone 3a. To a solution of enaminone **2** (1 mmol) in 2 mL acetic acid was added aniline (1 mmol) and the resulting mixture was stirred at room temperature when a solid product precipitated out. After the completion of the reaction (tlc, 45 hours), the mixture was poured over chilled water and the precipitated product was collected by filtration, washed repeatedly by water to ensure complete removal of acid and dried to give practically pure **3a** in 82% yields. It was recrystallised from hexane-ethyl acetate.

3a was obtained as a pale yellow solid, mp 149-150 °C, ir (KBr): 1566, 1639, 3032, 3217 cm⁻¹; ¹H nmr (CDCl₃): δ 6.00 (d, 1H, J=6 Hz), 7.13-7.16 (m, 3H), 7.36-7.41 (m, 2H), 7.61 (dd, 1H, 6Hz, 12Hz), 7.73 (d, 2H, 6Hz), 8.76 (d, 2H, 6Hz), 12.25 (d, 1H, 12Hz); MS: m/z 224 (M⁺), 225 (MH⁺). *Anal.* Calcd for C₁₄H₁₂N₂O: C, 74.98; H, 5.39; N, 12.49. Found: C, 74.75; H, 5.50; N, 12.42%.

3-Benzylamino-1-pyridin-4-ylpropenone 3b. To a solution of enaminone **2** (1 mmol) in 3 ml ethanol was added benzylamine (1.2 mmol) and the resulting mixture was refluxed. After the completion of the reaction (tlc, 48 hours), ethanol was distilled off to give a gum, which on trituration with hexane yielded practically pure **3b** in 61% yield. It was recrystallised from hexane-ethylacetate.

3b was obtained as a light brown solid, mp 113-115 °C ir (KBr): 1566, 1639, 3025, 3443 cm⁻¹; ¹H nmr (CDCl₃): δ 4.49 (d, 2H, J= 6Hz), 5.74 (d, 1H, J=6Hz), 7.10 (dd, 1H, J=6 Hz, 12.9 Hz), 7.27-7.39 (m, 5H), 7.66 (d, 2H, J=5.7), 8.68 (d, 2H, J=5.7), 10.76 (br s, 1H); ¹³C nmr (CDCl₃): δ 52.9, 90.6, 120.7, 127.3, 128.0, 128.9, 137.1, 146.1, 150.3, 155.2, 187.7; MS: m/z 238 (M⁺), 239 (MH⁺). *Anal.* Calcd for C₁₅H₁₄N₂O: C, 75.61; H, 5.92; N, 11.76. Found: C, 75.85; H, 6.01; N, 11.82%.

3-Methylamino-1-pyridin-4-ylpropenone 3c. To a solution of enaminone **2** (1 mmol) in 3 ml ethanol was added an aqueous solution of methylamine (3 mmol, 40% solution) and the resulting mixture was stirred at 50°C. After the completion of the reaction (tlc, 40 hours), ethanol was distilled off to give a brown gum, which was dissolved in chloroform (3 mL). This solution was washed with water (2X 2 mL), dried over anhydrous Na₂SO₄ and chloroform distilled off to give the product in 52% yields. It was further purified by column chromatography (silica gel, 20% EtOAc-hexane).

3c was obtained as light brown gum, ir (KBr): 1527, 1566, 1639, 3005, 3244 cm⁻¹; ¹H nmr (CDCl₃): δ 3.15 (d, 3H, J=6Hz), 5.90 (d, 1H, J=7.5Hz), 7.30 (dd, 1H, J=7.5, 12Hz), 7.95 (d, 2H, J=6Hz), 9.10 (d, 2H, J=6Hz), 11.01 (m, 1H). *Anal.* Calcd for C₉H₁₀N₂O: C, 66.65; H, 6.21; N, 17.27. Found: C, 66.51; H, 6.28; N, 17.36%.

(1,2,3,4-Tetrahydro-1,3-disubstitutedpyrimidin-5-yl)(pyridin-4-yl)methanone 4a-i. General procedure

A mixture of primary amine (1 mmol), formaldehyde (2 mmol, 40% solution) in 1mL methanol was stirred at room temperature for 5-10 minutes. To this was added a solution of **3** (1 mmol) in 3 mL of methanol and the resulting mixture was refluxed. At the end of the reaction (5-28 hours, monitored by tlc), methanol was removed under reduced pressure. The residue was dissolved in

chloroform (3 mL), the solution washed with water (2X2 mL), dried over anhydrous Na_2SO_4 and the solvent distilled off to give a gum. The gum was triturated with hexane (**4a-c,e,f**) to give practically pure product or was subjected to column chromatography (**4d,g-i**) using silica gel and EtOAc as eluent. **4a-c,e-f** were further purified by crystallization from EtOAc -hexane.

(1,2,3,4-Tetrahydro-3-methyl-1-phenylpyrimidin-5-yl)(pyridin-4-yl)methanone 4a. Pale yellow solid, yield: 80%, mp 115-117 $^{\circ}\text{C}$; ir (KBr): 1493, 1573 cm^{-1} ; ^1H nmr (CDCl_3): δ 2.53 (s, 3H), 3.77 (s, 2H), 4.50 (s, 2H), 6.95 (d, 2H), 7.14-7.18 (m, 1H), 7.33-7.46 (m, 5H), 8.69 (d, 2H); ^{13}C nmr (CDCl_3): δ 41.0, 49.1, 69.7, 108.8, 118.8, 122.3, 124.9, 129.8, 144.1, 145.6, 146.9, 150.0, 191.2; MS: m/z 280 (MH^+).

Anal. Calcd for $\text{C}_{17}\text{H}_{17}\text{N}_3\text{O}$: C, 73.10; H, 6.13, N, 15.04. Found: C, 73.31; H, 6.19; N, 15.11%.

(1,2,3,4-Tetrahydro-3-benzyl-1-phenylpyrimidin-5-yl)(pyridin-4-yl)methanone 4b. Pale yellow solid, yield: 78%, mp 139-140 $^{\circ}\text{C}$; ir (KBr): 1500, 1600 cm^{-1} ; ^1H nmr (CDCl_3): δ 3.77 (s, 2H), 3.90 (s, 2H), 4.51 (s, 2H), 6.88 (d, 2H), 7.11-7.16 (m, 1H), 7.27-7.35 (m, 7H), 7.40-7.42 (m, 2H), 7.42-7.51 (m, 1H), 8.69 (d, 2H); ^{13}C nmr (CDCl_3): δ 47.1, 57.0, 67.0, 108.9, 118.7, 122.3, 124.8, 127.6, 128.4, 129.0, 129.7, 137.3, 144.0, 146.0, 146.9, 150.0, 191.2; MS: m/z 355 (M^+), 356 (MH^+). *Anal.* Calcd for $\text{C}_{23}\text{H}_{21}\text{N}_3\text{O}$: C, 77.72; H, 5.96, N, 11.82. (1,2,3,4-Tetrahydro-1-methyl-3-phenylpyrimidin-5-yl)(pyridin-4-yl)methanone 4i. Light brown gum, yield: 80%, ir (KBr): 1546, 1593 cm⁻¹; ¹H nmr (CDCl₃): δ 2.99 (s, 3H), 4.33 (s, 2H), 4.63 (s, 2H), 6.92-7.02 (m, 4H), 7.26-7.32 (m, 4H) 8.64 (d, 2H). ¹³C nmr (CDCl₃): δ 28.68, 40.09, 44.14, 65.53, 105.06, 116.77, 121.40, 121.66, 128.38, 147.47, 148.75, 150.91, 188.03. *Anal.* Calcd for C₁₇H₁₇N₃O: C, 73.10; H, 6.13; N, 15.04. Found: C, 73.26; H, 6.06; N, 15.11%.

Synthesis of bis-tetrahydropyrimidines. General procedure

A mixture of diamine (0.5 mmol) and formaldehyde (2 mmol) in 1 mL of methanol was stirred at room temperature for 5-10 minutes. To this was added a solution of the enaminone **3** (1 mmol) in 4 mL of methanol and the resulting solution was refluxed for 4-12 hours. On completion of the reaction (tlc), the solvent was distilled off. The residue was dissolved in 3 mL of chloroform and the solution washed with water (2X2 mL), dried (Na₂SO₄) and chloroform distilled off to give a gum from which the product **4** was isolated by column chromatography (silica gel, EtOAc) in 40-65% yields.

[3,3'-(Ethane-1,2-diyl)bis(1-phenyl-1,2,3,4-tetrahydropyrimidine-5,3-diyl)]bis (pyridin-4-ylmethanone) 5a. White solid, yield 55%, mp 189-191 °C; ir (KBr): 1541, 1596, 1649 cm⁻¹; ¹H nmr (CDCl₃): δ 2.80 (s, 4H), 3.83 (s, 4H), 4.64 (s, 4H), 6.92 (d, 4H), 7.15-7.20 (m, 2H), 7.27-7.51 (m, 10H), 8.69 (d, 4H); MS: m/z 556 (M⁺). *Anal.* Calcd for C₃₄H₃₂N₆O₂: C, 73.36; H, 5.79; N, 15.10. Found: C, 73.55; H, 5.73; N, 15.02%.

(3,3'-(Propane-1,3-diyl)bis(1-phenyl-1,2,3,4-tetrahydropyrimidine-5,3-diyl))bis(pyridin-4-ylmethanone) 5b. White solid, yield 65%, mp 193-195 °C; ir (KBr): 1495, 1568 cm⁻¹; ¹H nmr (CDCl₃): δ 1.75-1.82 (m, 2H), 2.68 (t, 4H), 3.78 (s, 4H), 4.54 (s, 4H), 6.93 (d, 4H) 7.13-7.18 (m, 2H), 7.27-7.50 (m, 10H), 8.69 (d, 4H); ¹³C nmr (CDCl₃): δ 26.3, 47.3, 50.3, 68.4, 108.9, 118.6, 122.3, 124.9, 129.8, 144.0, 146.0, 146.8, 150.0, 191.2. *Anal.* Calcd for C₃₅H₃₄N₆O₂: C, 73.66; H, 6.01; N, 14.73. Found: C, 73.81; H, 6.09; N, 14.81%.

(3,3'-(Butane-1,4-diyl)bis(1-phenyl-1,2,3,4-tetrahydropyrimidine-5,3-diyl))bis(pyridin-4-yl-methanone) 5c. Light yellow solid, yield 60%, mp 153-154 °C; ir (KBr): 1498, 1568 cm⁻¹; ¹H nmr (CDCl₃): δ 1.60-1.61 (m, 4H), 2.59-2.60 (m, 4H), 3.79 (s, 4H), 4.54 (s, 4H), 6.93 (d, 4H),

7.14-7.18 (m, 2H), 7.27-7.45 (m, 10H), 8.69 (d, 4H); MS: m/z 585 (MH^+). *Anal.* Calcd for $C_{36}H_{36}N_6O_2$: C, 73.95; H, 6.21; N, 14.37. Found: C, 73.83; H, 6.25; N, 14.32%.

(3,3'-(1,4-Phenylene)bis(1-phenyl-1,2,3,4-tetrahydropyrimidine-5,3-diyl))bis(pyridin-4-yl-methanone) 5d. Yellow solid, yield 62%, mp 168-170 °C; ir (KBr): 1563, 1619, 1655 cm^{-1} ; 1H nmr ($CDCl_3$): 84.39 (s, 4H), 5.08 (s, 4H), 6.87-6.93 (m, 4H), 7.15-7.46 (m, 16H), 8.68 (d, 4H); MS: m/z 605 (MH^+). *Anal.* Calcd for $C_{38}H_{32}N_6O_2$: C, 75.48; H, 5.33; N, 13.90. Found: C, 75.31; H, 5.38; N, 13.84%.

(3,3'-(Ethane-1,2-diyl)bis(1-benzyl-1,2,3,4-tetrahydropyrimidine-5,3-diyl))bis(pyridin-4-yl-methanone) 5e. Light brown gum, yield 45%, ir (KBr): 1561, 1656 cm^{-1} ; 1H nmr ($CDCl_3$): 82.55 (s, 4H), 3.63 (s, 4H), 3.98 (s, 4H), 4.27 (s, 4H), 7.18-7.32 (m, 16H), 8.65 (d, 4H); ^{13}C nmr ($CDCl_3$): 829.5, 46.9, 50.5, 58.2, 67.3, 104.9, 121.0, 122.3, 127.6, 128.4, 129.0, 147.3, 150.5, 189.7. *Anal.* Calcd for $C_{36}H_{36}N_6O_2$: C, 73.95; H, 6.21; N, 14.37. Found: C, 73.99; H, 6.26; N, 14.41%.

(3,3'-(Propane-1,3-diyl)bis(1-benzyl-1,2,3,4-tetrahydropyrimidine-5,3-diyl))bis(pyridin-4-ylmethanone) 5f. Light brown gum, yield 45%, ir (KBr): 1563, 1656 cm^{-1} ; 1H nmr ($CDCl_3$); δ1.42-1.52 (m, 2H), 2.40 (t, 4H), 3.61 (s, 4H), 3.86 (s, 4H), 4.27 (s, 4H) 7.17-7.19 (m, 6H), 7.32-7.37 (m, 10H), 8.63 (d, 4H); ^{13}C nmr ($CDCl_3$): δ 25.6, 47.0, 50.4, 51.8, 58.1, 66.4, 105.0, 121.0, 122.2, 127.4, 128.5, 128.9, 147.3, 149.6, 189.5. *Anal.* Calcd for $C_{37}H_{38}N_6O_2$: C, 74.22; H, 6.40; N, 14.04. Found: C, 74.05; H, 6.43; N, 14.11%.

(3,3'-(Butane-1,4-diyl)bis(1-benzyl-1,2,3,4-tetrahydropyrimidine-5,3-diyl))bis(pyridin-4-yl-methanone) 5g. Light brown gum, yield 50%, ir (KBr): 1563, 1659 cm^{-1} ; 1H nmr ($CDCl_3$): δ1.25-1.33 (m, 4H), 2.34-2.41 (m, 4H), 3.64 (s, 4H), 3.93 (s, 4H), 4.27 (s, 4H) 7.15-7.35 (m, 16H), 8.67 (d, 4H); MS: m/z 612 (M^+). *Anal.* Calcd for $C_{38}H_{40}N_6O_2$: C, 74.48; H, 6.58; N, 13.71. (3,3'-(1,4-Phenylene)bis(1-methyl-1,2,3,4-tetrahydropyrimidine-5,3-diyl))bis(pyridin-4-yl-methanone) 5l. Light brown solid, yield 40%, mp 235 $^{\circ}\text{C}$; ir (KBr): 1615, 1654 cm^{-1} ; ^1H nmr (CDCl_3): δ 3.01 (s, 6H), 4.25 (s, 4H), 4.59 (s, 4H), 6.95-6.99 (m, 6H), 7.32-7.33 (m, 4H), 8.64-8.70 (m, 4H). ^{13}C nmr (CDCl_3): 40.7, 45.1, 66.6, 105.2, 118.8, 121.9, 142.6, 146.9, 149.4, 151.7, 188.40. *Anal.* Calcd for $\text{C}_{28}\text{H}_{28}\text{N}_6\text{O}_2$: C, 69.98; H, 5.87; N, 17.49. Found: C, 69.85; H, 5.90; N, 17.61%.

Anti-bacterial assay

Lyophilized cultures of the bacterial species (Table 1) were procured from the microbial type culture collection (MTCC) of the Institute of Microbial Technology, Chandigarh, India. Microbial cultures were developed by the Cup Plate Method.¹⁸ The test molecules, dissolved in the appropriate solvent at 10 mg/ml, 5 mg/ml, 2.5 mg/ml and 1.25 mg/ml concentrations were loaded in the cups. Rifampicin (1mg/ml) was loaded in one well as the antibiotic standard. In the plates containing cultures of *B. mycoides* acetone was loaded in one well as the solvent control while in the plates containing other bacterial cultures, DMF was loaded as the solvent control. The volume of material loaded in each well was 10 μl .

Zones of inhibition were considered as indications of anti-bacterial effect of the test compounds and of rifampicin. Observation and measurement of zones of inhibition were done after incubation at 37 $^{\circ}\text{C}$ for 24 hr. The diameter of a zone of inhibition in each replication was recorded and subjected to Analysis of Variance (ANOVA) followed by Tukey's Honestly Significant Difference (Tukey HSD) test to estimate the existence of significant difference between mean zones of inhibition.

Acknowledgements

The authors wish to thank the Principal, Rev. Fr. Ioannis Warpakma, SDB for the facilities and Rev. Fr. Stephen Mavely, SDB and Rev. Fr. Joseph Nellanatt, SDB for their encouragement during the course of this investigation. The financial support from ICAR-NATP-PIU and UGC-New Delhi is gratefully acknowledged. Authors (KC & MCD) thank ICAR for Senior Research Fellowships. Thanks are also due to the Heads of RSIC-CDRI (Lucknow) and RSIC-NEHU (Shillong) for recording spectra.
