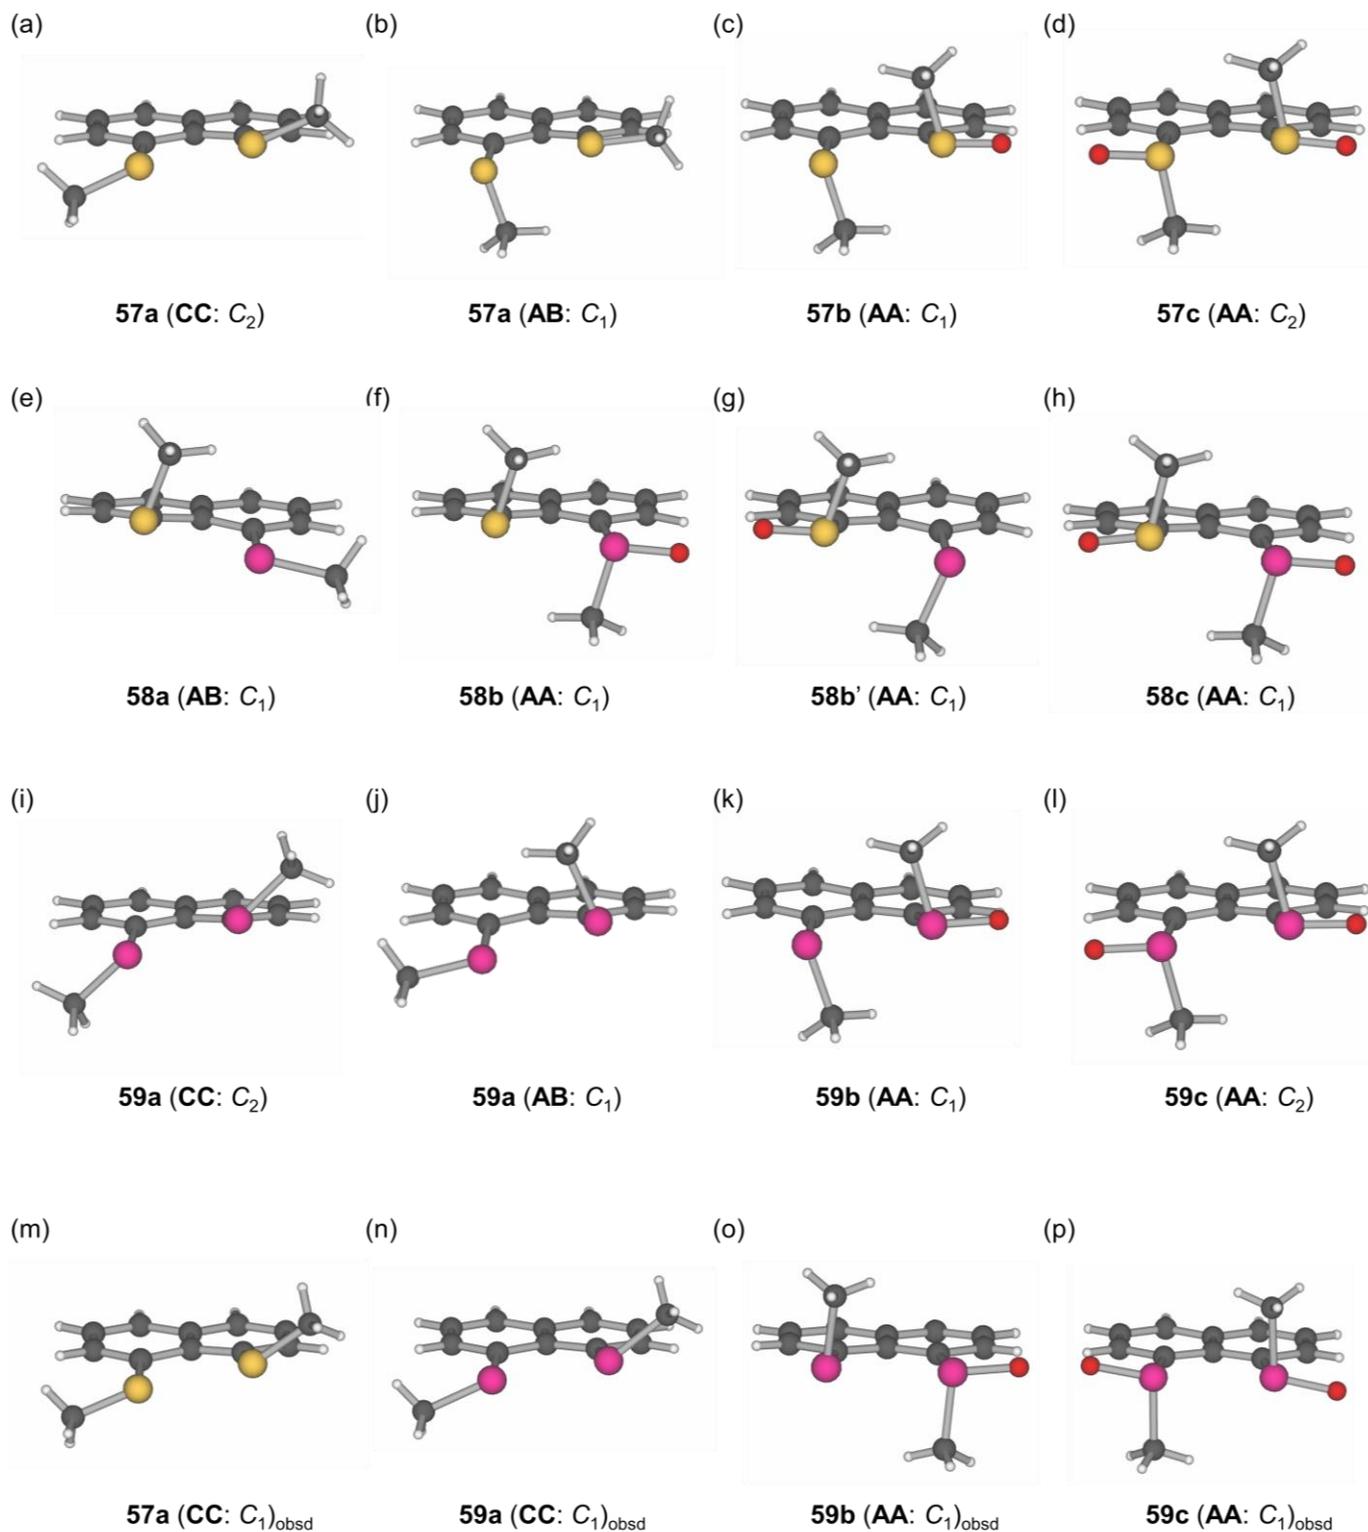

**Scheme S1.** Definition of selected structural parameters (a) and types for **A**, **B**, and **C**, together with **AA**, **AB**, **BB**, and **CC** (b).

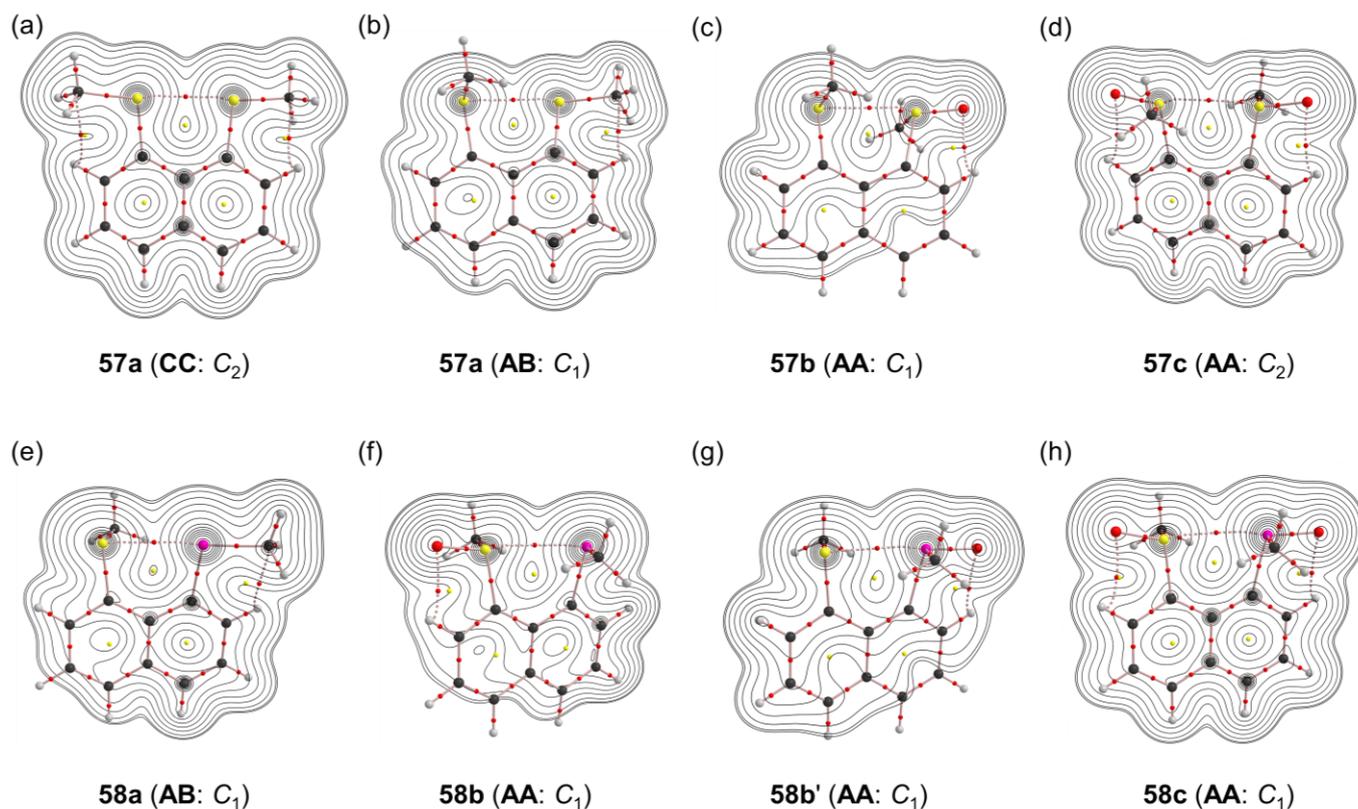

**Figure S1.** Plots of  $(w'/w)_{POM-M}$  and  $(w'/w)_{POM-Z}$  versus  $(w'/w)_{CIV}$  for **1–56**, except for diatomic molecules of **46–48** and **56**, evaluated with MP2/S-TZPsp. The correlations are shown in the figure.

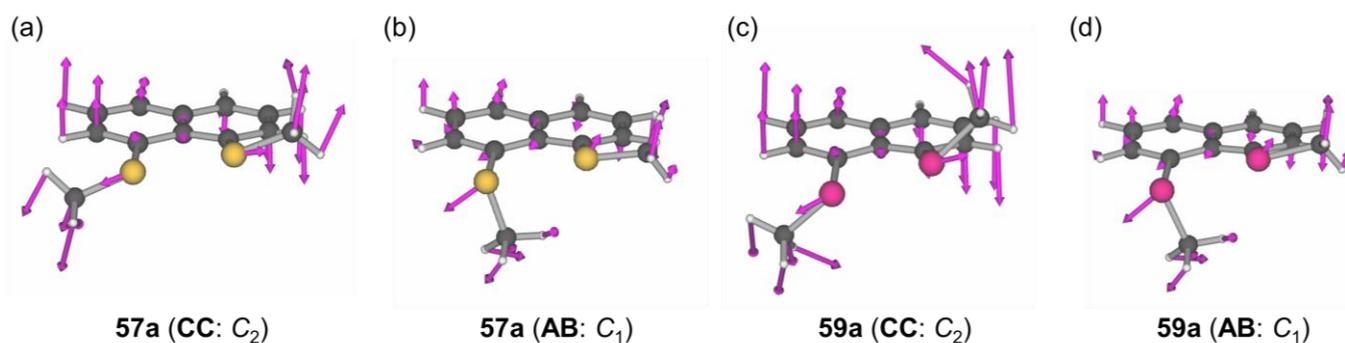

**Figure S2.** QAIM-DFA plots of  $H_b(r_c)$  versus  $H_b(r_c) - V_b(r_c)/2$  for **1–56**, together with the perturbed structures generated employing POM-M under the MP2/S-TZPsp condition. Whole picture of the plots (a) and the partial one for **37–49** (b). The numbers and colors in the figure are the same as those in Table 3 in the text.

**Figure S3.** Top views of optimized structures for **57a–59c**, (a)–(l), respectively, evaluated by MP2/S-TZPsp, together with observed structures for **57a** (m), **59a** (n), **59b** (o), and **59c** (p). Carbon, hydrogen, selenium, sulfur, and oxygen atoms are shown in black, grey, pink, yellow, and red, respectively.

**Figure S4.** Molecular graphs for **57a–58c**, (a)–(h), respectively, evaluated with MP2/S-TZPsp. BCPs are denoted by red dots, RCP (ring critical points) by yellow dots and BPs by pink lines. Carbon, hydrogen, selenium, sulfur, and oxygen atoms are shown in black, grey, pink, yellow, and red, respectively. Contour plots are drawn on the planes containing  ${}^1E^*-{}^2E$  interaction. The contours ( $ea_0^{-3}$ ) are at  $2^l$  ( $l = \pm 8, \pm 7, \dots$  and 0).

**Figure S5.** The vibrational motions of CIV corresponding to  ${}^1E^*-{}^2E$  for **57a (CC:  $C_2$ )** (a), **59a (CC:  $C_2$ )** (b), **57a (AB:  $C_1$ )** (c), and **59a (AB:  $C_1$ )** (d). Carbon, hydrogen, selenium, and sulfur atoms are shown in black, grey, pink, and yellow, respectively.

**Optimized structures given by Cartesian coordinates**

Optimized structures given by Cartesian coordinates for examined molecules, together with the total energies, evaluated with MP2/S-TZPsp method of the Gaussian 09 program. S-TZPsp shows Sapporo-TZP with 1s1p diffuse functions. The optimized structures were confirmed by the frequency analysis.

## Appendix

### QTAIM Dual Functional Analysis (QTAIM-DFA)

The bond critical point (BCP; \*) is an important concept in QTAIM. The BCP of  $(\omega, \sigma) = (3, -1)^{SA1}$  is a point along the bond path (BP) at the interatomic surface, where charge density  $\rho(\mathbf{r})$  reaches a minimum. It is denoted by  $\rho_b(\mathbf{r}_c)$ , so are other QTAIM functions, such as the total electron energy densities  $H_b(\mathbf{r}_c)$ , potential energy densities  $V_b(\mathbf{r}_c)$  and kinetic energy densities  $G_b(\mathbf{r}_c)$  at the BCPs. A chemical bond or interaction between A and B is denoted by A–B, which corresponds to the BP between A and B in QTAIM. We will use A-\*B for BP, where the asterisk emphasizes the presence of a BCP in A–B.

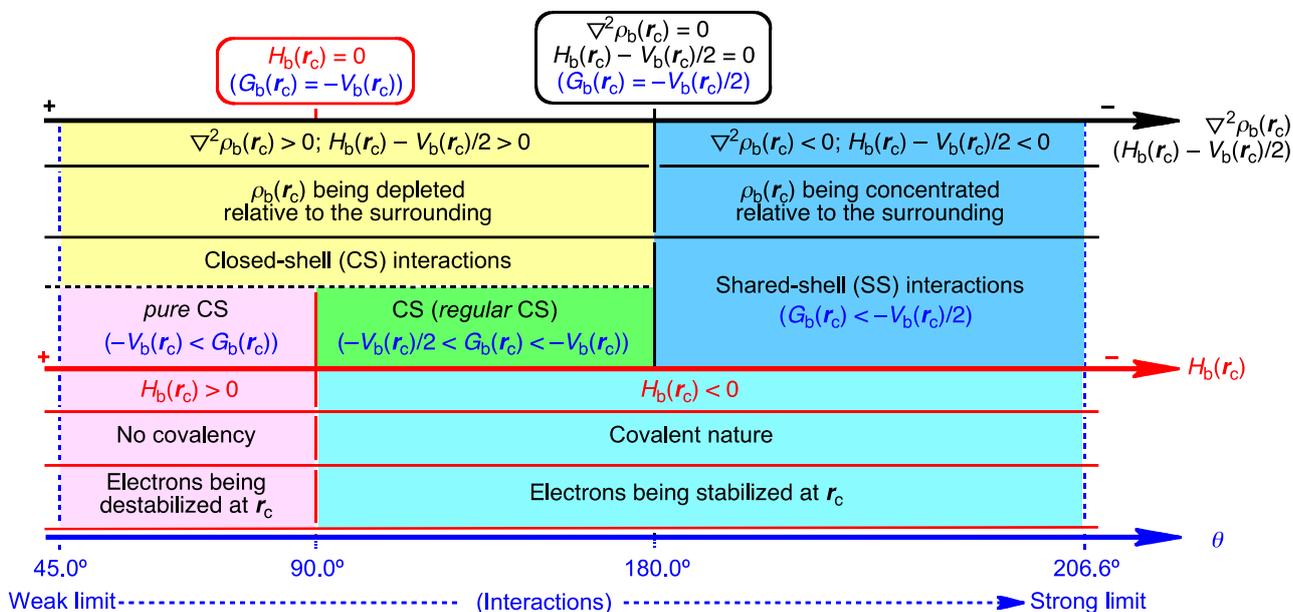

The sign of the Laplacian  $\rho_b(\mathbf{r}_c)$  ( $\nabla^2\rho_b(\mathbf{r}_c)$ ) indicates that  $\rho_b(\mathbf{r}_c)$  is depleted or concentrated with respect to its surrounding, since  $\nabla^2\rho_b(\mathbf{r}_c)$  is the second derivative of  $\rho_b(\mathbf{r}_c)$ .  $\rho_b(\mathbf{r}_c)$  is locally depleted relative to the average distribution around  $\mathbf{r}_c$  if  $\nabla^2\rho_b(\mathbf{r}_c) > 0$ , but it is concentrated when  $\nabla^2\rho_b(\mathbf{r}_c) < 0$ . Total electron energy densities at BCPs ( $H_b(\mathbf{r}_c)$ ) must be a more appropriate measure for weak interactions on the energy basis.<sup>SA1-SA8</sup>  $H_b(\mathbf{r}_c)$  are the sum of kinetic energy densities ( $G_b(\mathbf{r}_c)$ ) and potential energy densities ( $V_b(\mathbf{r}_c)$ ) at BCPs, as shown in eq (SA1). Electrons at BCPs are stabilized when  $H_b(\mathbf{r}_c) < 0$ , therefore, interactions exhibit the covalent nature in this region, whereas they exhibit no covalency if  $H_b(\mathbf{r}_c) > 0$ , due to the destabilization of electrons at BCPs under the conditions.<sup>SA1</sup> Eqs (SA2) and (SA2') represent the relations between  $\nabla^2\rho_b(\mathbf{r}_c)$  and  $H_b(\mathbf{r}_c)$ , together with  $G_b(\mathbf{r}_c)$  and  $V_b(\mathbf{r}_c)$ , which are closely related to the virial theorem.

$$H_b(\mathbf{r}_c) = G_b(\mathbf{r}_c) + V_b(\mathbf{r}_c) \quad (SA1)$$

$$(\hbar^2/8m)\nabla^2\rho_b(\mathbf{r}_c) = H_b(\mathbf{r}_c) - V_b(\mathbf{r}_c)/2 \quad (SA2)$$

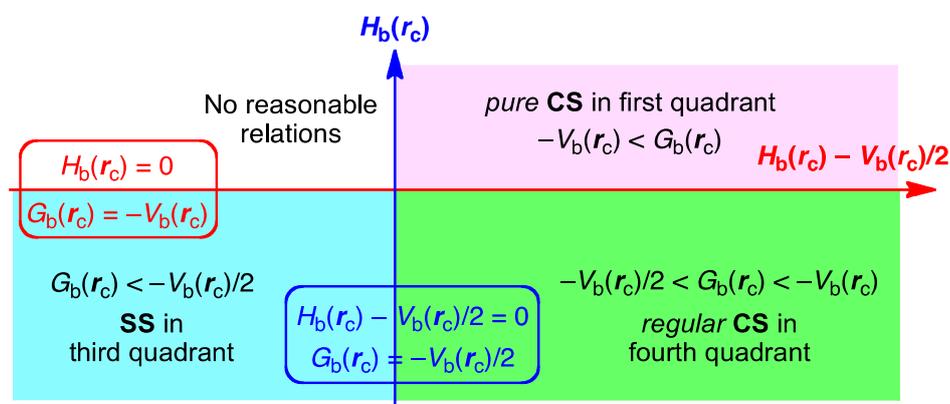

$$= G_b(\mathbf{r}_c) + V_b(\mathbf{r}_c)/2 \quad (SA2')$$

Interactions are classified by the signs of  $\nabla^2\rho_b(\mathbf{r}_c)$  and  $H_b(\mathbf{r}_c)$ . Interactions in the region of  $\nabla^2\rho_b(\mathbf{r}_c) < 0$  are called shared-shell (SS) interactions and they are closed-shell (CS) interactions for  $\nabla^2\rho_b(\mathbf{r}_c) > 0$ .  $H_b(\mathbf{r}_c)$  must be negative when  $\nabla^2\rho_b(\mathbf{r}_c) < 0$ , since  $H_b(\mathbf{r}_c)$  are larger than  $(\hbar^2/8m)\nabla^2\rho_b(\mathbf{r}_c)$  by  $V_b(\mathbf{r}_c)/2$  with negative  $V_b(\mathbf{r}_c)$  at all BCPs (eq (SA2)). Consequently,  $\nabla^2\rho_b(\mathbf{r}_c) < 0$  and  $H_b(\mathbf{r}_c) < 0$  for the SS interactions. The CS interactions are especially called *pure* CS interactions for  $H_b(\mathbf{r}_c) > 0$  and  $\nabla^2\rho_b(\mathbf{r}_c) > 0$ , since electrons at BCPs are depleted and destabilized under the conditions.<sup>SA1a</sup> Electrons in the intermediate region between SS and *pure* CS, which belong to CS, are locally depleted but stabilized at BCPs, since  $\nabla^2\rho_b(\mathbf{r}_c) > 0$  but  $H_b(\mathbf{r}_c) < 0$ .<sup>SA1a</sup> We call the interactions in this region *regular* CS,<sup>SA4,SA5</sup> when it is necessary to distinguish from *pure* CS. The role of  $\nabla^2\rho_b(\mathbf{r}_c)$  in the classification can be replaced by  $H_b(\mathbf{r}_c) - V_b(\mathbf{r}_c)/2$ , since  $(\hbar^2/8m)\nabla^2\rho_b(\mathbf{r}_c) = H_b(\mathbf{r}_c) - V_b(\mathbf{r}_c)/2$  (eq (SA2)). Scheme SA1 summarizes the classification.

**Scheme SA1.** Classification of interactions by the signs of  $\nabla^2\rho_b(r_c)$  and  $H_b(r_c)$ , together with  $G_b(r_c)$  and  $V_b(r_c)$ .

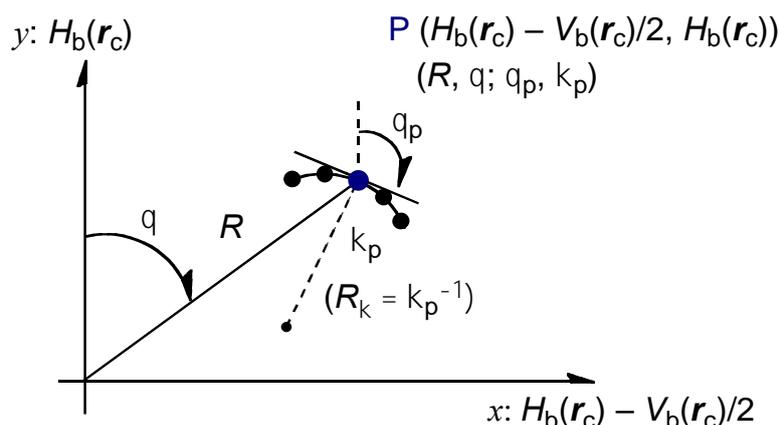

We proposed QTAIM-DFA by plotting  $H_b(r_c)$  versus  $H_b(r_c) - V_b(r_c)/2 = (\hbar^2/8m)\nabla^2\rho_b(r_c)$ ,<sup>SA4a</sup> after the proposal of  $H_b(r_c)$  versus  $\nabla^2\rho_b(r_c)$ .<sup>SA4b</sup> Both axes in the plot of the former are given in energy unit, therefore, distances on the  $(x, y) = (H_b(r_c) - V_b(r_c)/2, H_b(r_c))$  plane can be expressed in the energy unit, which provides an analytical development. QTAIM-DFA incorporates the classification of interactions by the signs of  $\nabla^2\rho_b(r_c)$  and  $H_b(r_c)$ . Scheme S2 summarizes the QTAIM-DFA treatment. Interactions of *pure CS* appear in the first quadrant, those of *regular CS* in the fourth quadrant and *SS* interactions do in the third quadrant. No interactions appear in the second one.

**Scheme SA2.** QTAIM-DFA: Plot of  $H_b(r_c)$  versus  $H_b(r_c) - V_b(r_c)/2$  for Weak to Strong Interactions.

In our treatment, data for perturbed structures around fully optimized structures are also employed for the plots, together with the fully optimized ones (see Fig. SA1).<sup>SA4-SA8</sup> We proposed the concept of the "dynamic nature of interaction" originated from the perturbed structures. The behavior of interactions at the fully optimized structures corresponds to "the static nature of interactions", whereas that containing

perturbed structures exhibit the "dynamic nature of interaction" as explained below. The method to generate the perturbed structures is discussed later. Plots of  $H_b(\mathbf{r}_c)$  versus  $H_b(\mathbf{r}_c) - V_b(\mathbf{r}_c)/2$  are analyzed employing the polar coordinate  $(R, \theta)$  representation with  $(\theta_p, \kappa_p)$  parameters.<sup>SA4a,SA5-SA8</sup> Fig. SA1 explains the treatment.  $R$  in  $(R, \theta)$  is defined by eq (SA3) and given in the energy unit. Indeed,  $R$  does not correspond to the usual interaction energy, but it does to the local energy at BCP, expressed by  $[(H_b(\mathbf{r}_c))^2 + (H_b(\mathbf{r}_c) - V_b(\mathbf{r}_c)/2)^2]^{1/2}$  in the plot (cf: eq (SA3)), where  $R = 0$  for the enough large interaction distance. The plots show a spiral stream, as a whole.  $\theta$  in  $(R, \theta)$  defined by eq (SA4), measured from the y-axis, controls the spiral stream of the plot. Each plot for an interaction shows a specific curve, which provides important information of the interaction (see Fig. SA1). The curve is expressed by  $\theta_p$  and  $\kappa_p$ . While  $\theta_p$ , defined by eq (SA5) and measured from the y-direction, corresponds to the tangent line of a plot, where  $\theta_p$  is calculated employing data of the perturbed structures with a fully-optimized structure and  $\kappa_p$  is the curvature of the plot (eq (SA6)). While  $(R, \theta)$  correspond to the static nature,  $(\theta_p, \kappa_p)$  represent the dynamic nature of interactions. We call  $(R, \theta)$  and  $(\theta_p, \kappa_p)$  QTAIM-DFA parameters, whereas  $\rho_b(\mathbf{r}_c)$ ,  $\nabla^2 \rho_b(\mathbf{r}_c)$ ,  $G_b(\mathbf{r}_c)$ ,  $V_b(\mathbf{r}_c)$ ,  $H_b(\mathbf{r}_c)$  and  $H_b(\mathbf{r}_c) - V_b(\mathbf{r}_c)/2$  belong to QTAIM functions.  $k_b(\mathbf{r}_c)$ , defined by eq (SA7), is an QTAIM function but it will be treated as if it were an QTAIM-DFA parameter, if suitable.

**Figure SA1.** Polar  $(R, \theta)$  coordinate representation of  $H_b(\mathbf{r}_c)$  versus  $H_b(\mathbf{r}_c) - V_b(\mathbf{r}_c)/2$ , with  $(\theta_p, \kappa_p)$  parameters.

$$R = (x^2 + y^2)^{1/2} \quad (\text{SA3})$$

$$\theta = 90^\circ - \tan^{-1}(y/x) \quad (\text{SA4})$$

$$\theta_p = 90^\circ - \tan^{-1}(dy/dx) \quad (\text{SA5})$$

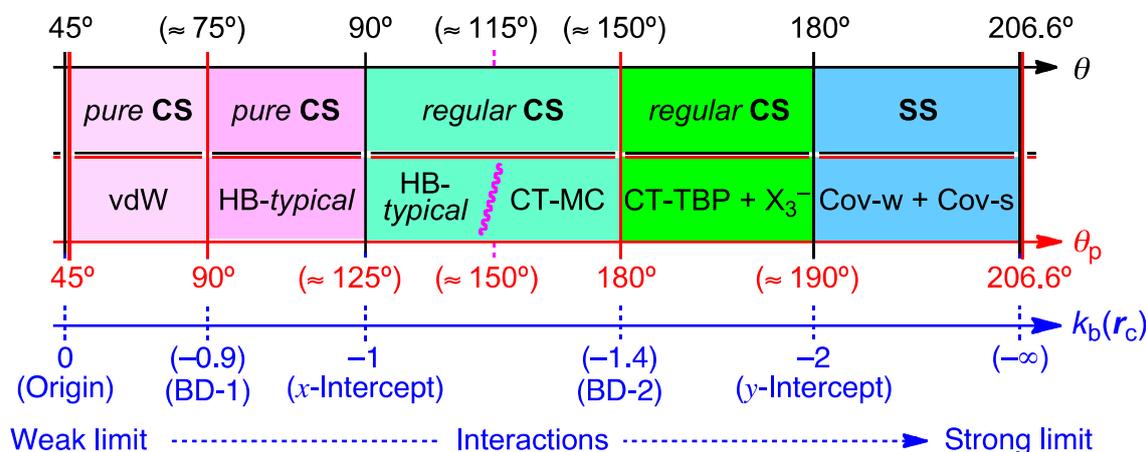

$$\kappa_p = |d^2y/dx^2| / [1 + (dy/dx)^2]^{3/2} \quad (\text{SA6})$$

$$k_b(\mathbf{r}_c) = V_b(\mathbf{r}_c)/G_b(\mathbf{r}_c) \quad (\text{SA7})$$

where  $(x, y) = (H_b(\mathbf{r}_c) - V_b(\mathbf{r}_c)/2, H_b(\mathbf{r}_c))$

### Criteria for Classification of Interactions: Behavior of Typical Interactions Elucidated by QTAIM-DFA

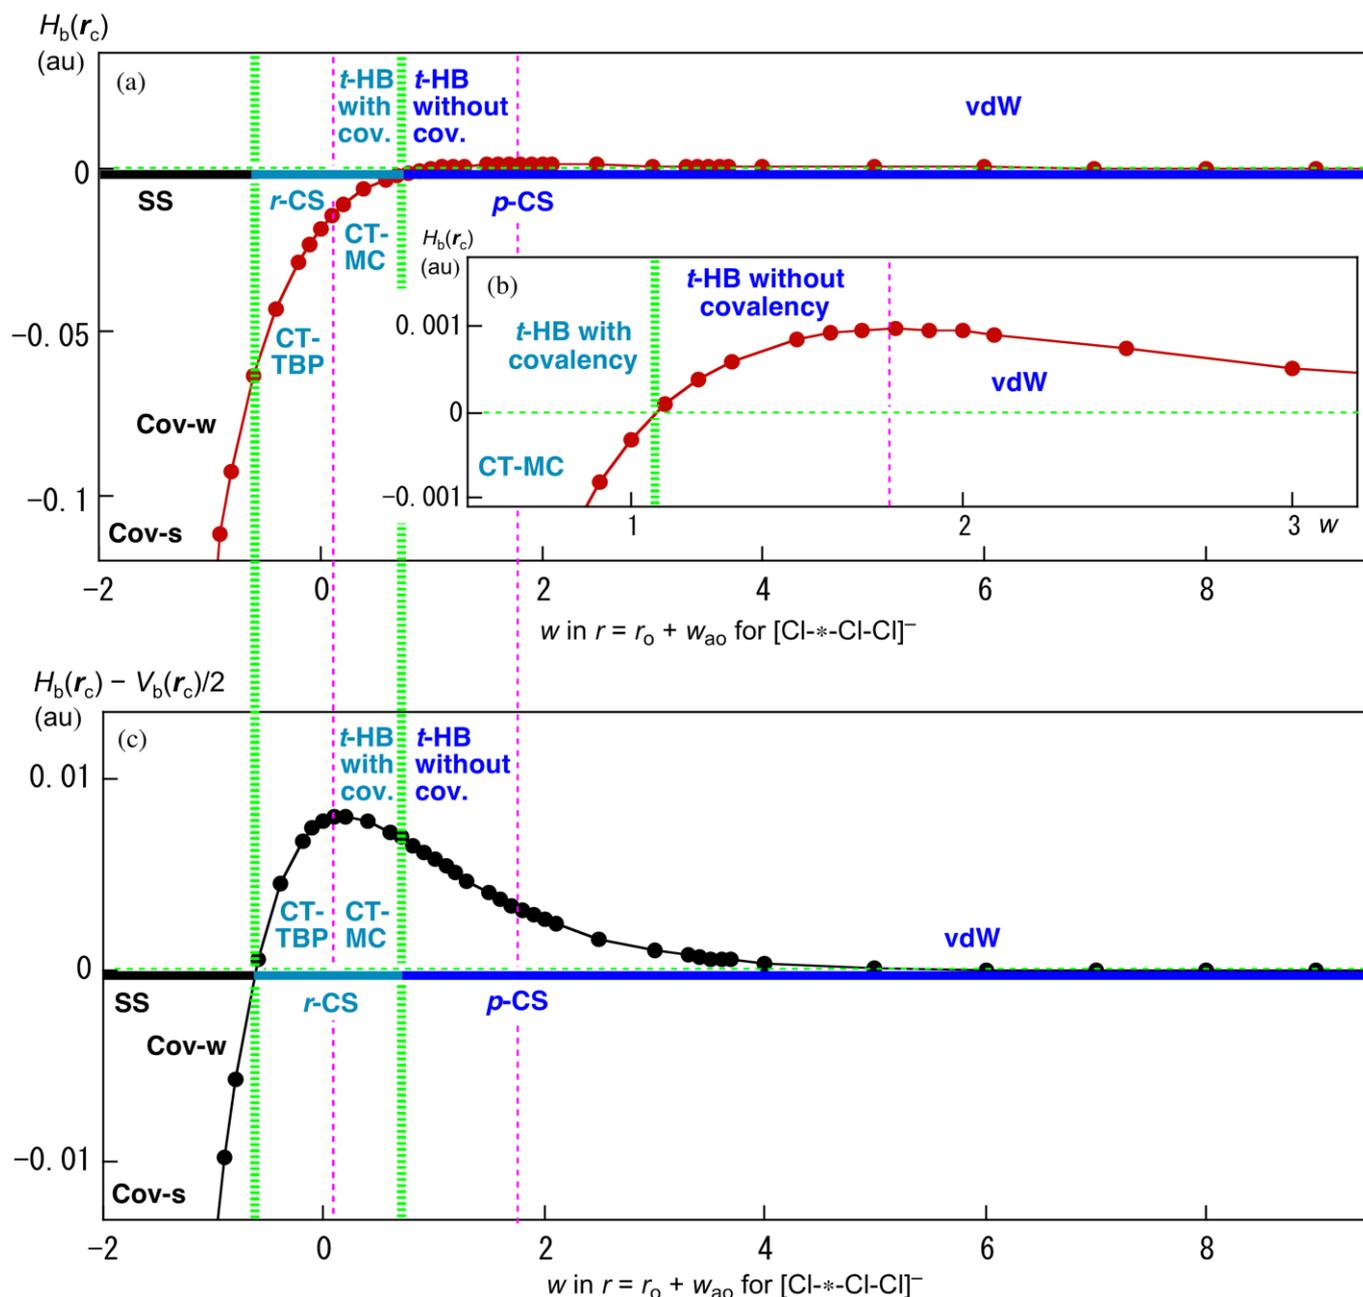

$H_b(r_c)$  are plotted versus  $H_b(r_c) - V_b(r_c)/2$  for typical interactions in vdW (van der Waals interactions), HBs (hydrogen bonds), CT-MCs (molecular complexes through charge transfer),  $X_3^-$  (trihalide ions), CT-TBPs (trigonal bipyramidal adducts through charge-transfer), Cov-w (weak covalent bonds) and Cov-s (strong covalent bonds).<sup>SA4–SA8</sup> Rough criteria are obtained by applying QTAIM-DFA, after the analysis of the plots for the typical interactions according to eqs (SA3)–(SA7). Scheme SA3 shows the rough criteria, which are accomplished by the  $\theta$  and  $\theta_p$  values, together with the values of  $k_b(r_c)$ . The criteria will be employed to discuss the nature of interactions in question, as a reference.

**Scheme SA3.** Rough classification and characterization of interactions by  $\theta$  and  $\theta_p$ , together with  $k_b(r_c)$  ( $= V_b(r_c)/G_b(r_c)$ ).

### Characterization of interactions

The characterization of interactions is explained employing  $[^1\text{Cl}^2\text{Cl}^3\text{Cl}]^-$ . The wide range of the perturbed structures were generated by partially optimizing  $r(^2\text{Cl}^3\text{Cl})$  in  $[^1\text{Cl}^2\text{Cl}^3\text{Cl}]^-$ , assuming the  $C_{\text{ov}}$  symmetry, with  $r(^1\text{Cl}^2\text{Cl})$  being fixed in the wide range. The partial optimization method is called POM.<sup>SA4b,SA5</sup> The QTAIM functions, such as  $V_b(r_c)$ ,  $G_b(r_c)$ ,  $H_b(r_c)$ ,  $H_b(r_c) - V_b(r_c)/2$  are calculated at BCPs for the wide varieties of the perturbed structures of  $[^1\text{Cl}^2\text{Cl}^3\text{Cl}]^-$ .  $H_b(r_c) - V_b(r_c)/2$  and  $H_b(r_c)$  are plotted versus the interaction distances  $r(^1\text{Cl}^2\text{Cl})$  in the perturbed structures of  $[^1\text{Cl}^2\text{Cl}^3\text{Cl}]^-$ , in the wide range. Figure SA2 shows the plots. Each plot is analyzed using a regression curve of the ninth function and the first derivative of each regression curve is obtained. As shown in Figure SA2, the maximum value of  $H_b(r_c)$  ( $d(H_b(r_c))/dr = 0$ ) is defined as the borderline between vdW and t-HB interactions. Similarly, the maximum value of  $H_b(r_c) - V_b(r_c)/2$  ( $d(H_b(r_c) - V_b(r_c)/2)/dr = 0$ ) does to the borderline between CT-MC and CT-TBP. However, it seems difficult to find a characteristic point corresponding to the borderline between t-HB and CT-MC in nature. Therefore, the borderline is tentatively given by  $\theta_p = 150^\circ$  based on the expectation from the experimental results, where  $\theta_p$  is defined by  $[90^\circ - \tan^{-1}[dH_b(r_c)/d(H_b(r_c) - V_b(r_c)/2)]]$  in the plot of  $H_b(r_c)$  versus  $H_b(r_c) - V_b(r_c)/2$ . The proposed classification and characterization of interactions, by means of the QTAIM functions of  $H_b(r_c)$ ,  $H_b(r_c) - V_b(r_c)/2$ ,  $G_b(r_c)$  and/or  $V_b(r_c)$ , are summarized in Table SA1. The plot of  $H_b(r_c) - V_b(r_c)/2$  versus  $w$  in Fig. SA2 is essentially the same as that of  $\nabla^2\rho_b(r_c)$  versus  $d(\text{H}---\text{F})$  in  $\text{X}-\text{H}---\text{F}-\text{Y}$ , presented by Espinosa and co-workers.<sup>SA9</sup>

**Figure SA2** Plot of  $H_b(r_c)$  versus  $w$  in  $r(^1\text{Cl}^-\text{Cl}^-\text{Cl}) = r_o(^1\text{Cl}^-\text{Cl}^-\text{Cl}) + w_{a0}$  for  $^1\text{Cl}^-\text{Cl}^-\text{Cl}^-\text{Cl}^-$  (a) with the magnified picture of (a) (b) and that of  $H_b(r_c) - V_b(r_c)/2$  versus  $w$  (c). Typical hydrogen bonds without covalency and typical hydrogen bonds with covalency are abbreviated as  $t$ -HB without cov. and  $t$ -HB with cov., respectively, whereas Cov-w and Cov-s stand for weak covalent bonds and strong covalent bonds, respectively.

**Table SA1.** Proposed definitions for the classification and characterization of interactions by the signs  $H_b(\mathbf{r}_c)$  and  $H_b(\mathbf{r}_c) - V_b(\mathbf{r}_c)/2$  and their first derivatives, together with the tentatively proposed definitions by the characteristic points on the plots of  $H_b(\mathbf{r}_c)$  versus  $H_b(\mathbf{r}_c) - V_b(\mathbf{r}_c)/2$ . The tentatively proposed definitions are shown by italic. The requirements for the interactions are also shown.

ChP/Interaction	Requirements by $H_b(\mathbf{r}_c)$ and $V_b(\mathbf{r}_c)$	Requirements by $G_b(\mathbf{r}_c)$ and $V_b(\mathbf{r}_c)$
Origin	$H_b(\mathbf{r}_c) - V_b(\mathbf{r}_c)/2 = 0; H_b(\mathbf{r}_c) = 0$	$G_b(\mathbf{r}_c) = 0; V_b(\mathbf{r}_c) = 0$
vdW	$H_b(\mathbf{r}_c) > 0; dH_b(\mathbf{r}_c)/d(-r) > 0$	$G_b(\mathbf{r}_c) > -V_b(\mathbf{r}_c); dG_b(\mathbf{r}_c)/d(-r) > -dV_b(\mathbf{r}_c)/d(-r)$
Borderline (BD-1)	$H_b(\mathbf{r}_c) > 0; dH_b(\mathbf{r}_c)/d(-r) = 0$	$G_b(\mathbf{r}_c) > -V_b(\mathbf{r}_c); dG_b(\mathbf{r}_c)/d(-r) = -dV_b(\mathbf{r}_c)/d(-r)$
<i>t</i> -HB <sub>with no covalency</sub>	$H_b(\mathbf{r}_c) > 0; dH_b(\mathbf{r}_c)/d(-r) < 0$	$G_b(\mathbf{r}_c) > -V_b(\mathbf{r}_c); dG_b(\mathbf{r}_c) < -dV_b(\mathbf{r}_c)$
Borderline (x-intercept)	$H_b(\mathbf{r}_c) = 0$ ( $\theta_p^a = 125^\circ$ )	$G_b(\mathbf{r}_c) = -V_b(\mathbf{r}_c)$ ( $\theta_p^a = 125^\circ$ )
<i>t</i> -HB <sub>with covalency</sub>	$H_b(\mathbf{r}_c) < 0; (125^\circ <) \theta_p^a < 150^\circ$	$G_b(\mathbf{r}_c) < -V_b(\mathbf{r}_c); (125^\circ <) \theta_p^b < 150^\circ$
<i>Borderline (Tentative)</i>	$\theta_p^a = 150^\circ$	$\theta_p^b = 150^\circ$
CT-MC	$d(H_b(\mathbf{r}_c) - V_b(\mathbf{r}_c)/2)/d(-r) > 0;$ $150^\circ < \theta_p^a < 180^\circ$	$dG_b(\mathbf{r}_c) > dV_b(\mathbf{r}_c)/2;$ $150^\circ < \theta_p^a < 180^\circ$
Borderline (BD-2)	$d(H_b(\mathbf{r}_c) - V_b(\mathbf{r}_c)/2)/d(-r) = 0$ $(H_b(\mathbf{r}_c) - V_b(\mathbf{r}_c)/2 > 0; H_b(\mathbf{r}_c) < 0)$	$2dG_b(\mathbf{r}_c)/d(-r) = -dV_b(\mathbf{r}_c)/d(-r)$ $(-V_b(\mathbf{r}_c)/2 < G_b(\mathbf{r}_c) < -V_b(\mathbf{r}_c))$
CT-TBP with $X_3^-$	$d(H_b(\mathbf{r}_c) - V_b(\mathbf{r}_c)/2)/d(-r) < 0$ $(H_b(\mathbf{r}_c) - V_b(\mathbf{r}_c)/2 > 0; H_b(\mathbf{r}_c) < 0)$	$2dG_b(\mathbf{r}_c)/d(-r) < -dV_b(\mathbf{r}_c)/d(-r)$ $(-V_b(\mathbf{r}_c)/2 < G_b(\mathbf{r}_c) < -V_b(\mathbf{r}_c))$
Borderline (y-intercept)	$H_b(\mathbf{r}_c) - V_b(\mathbf{r}_c)/2 = 0$ ( $H_b(\mathbf{r}_c) < 0$ )	$G_b(\mathbf{r}_c) = -V_b(\mathbf{r}_c)/2$ ( $G_b(\mathbf{r}_c) < -V_b(\mathbf{r}_c)$ )
Cov-w	$H_b(\mathbf{r}_c) - V_b(\mathbf{r}_c)/2 < 0; R^c < 0.15 \text{ au}$	$G_b(\mathbf{r}_c) < -V_b(\mathbf{r}_c)/2; R^c < 0.15 \text{ au}$
<i>Borderline (Tentative)</i>	$R^c = 0.15 \text{ au}$	$R^d = 0.15 \text{ au}$
Cov-s	$H_b(\mathbf{r}_c) - V_b(\mathbf{r}_c)/2 < 0; R^c > 0.15 \text{ au}$	$G_b(\mathbf{r}_c) < -V_b(\mathbf{r}_c)/2; R^d > 0.15 \text{ au}$

<sup>a</sup>  $\theta_p = 90^\circ - \tan^{-1} [dH_b(\mathbf{r}_c)/d(H_b(\mathbf{r}_c) - V_b(\mathbf{r}_c)/2)]$ ,  $\theta_p = 125^\circ$  is tentatively given for  $\theta = 90^\circ$ , where  $\theta$  is defined by  $90^\circ - \tan^{-1} [H_b(\mathbf{r}_c)/(H_b(\mathbf{r}_c) - V_b(\mathbf{r}_c)/2)]$  with  $H_b(\mathbf{r}_c) = 0$ . <sup>b</sup>  $\theta_p = 90^\circ - \tan^{-1} [d(G_b(\mathbf{r}_c) + V_b(\mathbf{r}_c))/d(G_b(\mathbf{r}_c) + V_b(\mathbf{r}_c)/2)]$ ,  $\theta_p = 125^\circ$  is tentatively given for  $\theta = 90^\circ$ , where  $\theta$  is defined by  $90^\circ - \tan^{-1} [(G_b(\mathbf{r}_c) + V_b(\mathbf{r}_c))/(G_b(\mathbf{r}_c) + V_b(\mathbf{r}_c)/2)]$  with  $(G_b(\mathbf{r}_c) + V_b(\mathbf{r}_c)) = 0$ . <sup>c</sup>  $R = [(H_b(\mathbf{r}_c) - V_b(\mathbf{r}_c)/2)^2 + (H_b(\mathbf{r}_c))^2]^{1/2}$ . <sup>d</sup>  $R = [(G_b(\mathbf{r}_c) + V_b(\mathbf{r}_c)/2)^2 + (G_b(\mathbf{r}_c) + V_b(\mathbf{r}_c))^2]^{1/2}$ .
